TASK 1 REPORT

Internship Program — Batch 2026

Submitted By:	Hamza Badshah / Mtech-AI26028
Department:	AI / ML

1. Introduction

This report presents the work completed for **Task 2** of the M-Tech Production & Marketing AI/ML Internship Program, Batch 2026. The internship focuses on practical exposure to core concepts in Artificial Intelligence and Machine Learning, equipping interns with skills applicable to real-world technology and marketing challenges.

M-Tech Production & Marketing is a forward-looking company based in Haripur, KPK, specializing in Technology, Training, Marketing, and Projects. The internship is structured in a 9-Phase roadmap designed to progressively build theoretical knowledge and hands-on project experience.

2. Objectives

- Successfully install Anaconda Navigator on a local system and verify its proper setup.
 - Gain a foundational understanding of the Anaconda Navigator interface and its core features.
 - Learn how to launch and work with Jupyter Notebook and Spyder for Python development.
 - Understand how to manage Python environments and packages using Anaconda.
 - Compare the functionality of a local development environment with cloud-based platforms such as Google Colab.
 - Develop a clear understanding of the advantages, limitations, and appropriate use cases of both platforms.
-

3. Task Description

The assigned task involved installing Anaconda Navigator on my local computer and exploring its features as a Python development environment. After completing the installation, I learned how to launch Jupyter Notebook and Spyder, create and manage notebooks, and work with datasets in a local environment.

The task also required comparing Anaconda Navigator with Google Colab by evaluating their execution environment, hardware resource usage, internet requirements, data privacy, and setup process. This activity provided practical experience with local development tools and helped me understand when to use local or cloud-based platforms for different types of projects.

4. Work Done

- **Installation:** Successfully downloaded, installed, and configured Anaconda Navigator on my local system.
- **Environment Exploration:** Explored the Anaconda Navigator interface and became familiar with its available development tools.
- **Launched Jupyter Notebook:** Opened Jupyter Notebook, created a new Python notebook, and understood its basic workflow for writing and executing Python code.
- **Explored Spyder IDE:** Launched Spyder and observed its integrated development environment for Python programming and debugging.
- **Platform Comparison:** Performed a detailed comparison between Anaconda Navigator and Google Colab, focusing on execution, hardware dependency, internet requirements, data privacy, and setup.
- **Understanding Local Development:** Learned how local environments provide greater control over installed libraries, files, and project resources.

The screenshot shows the Anaconda website's download page. The browser's address bar displays 'anaconda.com/download'. The page features the Anaconda logo and navigation links for Products, Solutions, Resources, and Company. A 'Sign In' link and a green 'Get Demo' button are positioned in the top right. The main heading reads 'Get Started with Anaconda Distribution'. Below this, a paragraph states: 'Install Python, Jupyter, and thousands of data science packages in one step. Trusted by over 50 million users who need tools that work—without the setup headaches.' To the right, a 'Download Now' section offers access in 30 seconds, completely free. It includes a green 'Get Started >' button and a 'Returning Users' link. A disclaimer at the bottom of this section notes that users are subject to the Terms of Service and that organizations with more than 200 employees/contractors may require a paid business license. A 'Skip Registration >' link is also present. A link 'What's included in Anaconda Distribution?' is located at the bottom left of the main content area.

Get Started with Anaconda Distribution

Install Python, Jupyter, and thousands of data science packages in one step. Trusted by over 50 million users who need tools that work—without the setup headaches.

Launch Jupyter Notebook

The screenshot displays the Jupyter Notebook web interface. The top bar shows the Jupyter logo and a menu with File, View, Settings, and Help. Below the menu, there are tabs for 'Files' and 'Running'. The 'Files' tab is active, showing a file browser interface. A message at the top of the file browser says 'Select items to perform actions on them.' To the right of this message are buttons for 'New', 'Upload', and a refresh icon. The file browser lists various system folders such as 3D Objects, Contacts, Desktop, Documents, Downloads, Favorites, Links, Music, OneDrive, Pictures, Roaming, Saved Games, Searches, and Videos. Each folder entry includes a checkbox, the folder name, a 'Modified' timestamp (e.g., 'last month', '17 hours ago', '17 days ago', '16 minutes ago'), and a 'File Size' column. The 'Downloads' folder is highlighted.

Select items to perform actions on them.

▼ New Upload ↻

☐	Name	Modified	File Size
☐	3D Objects	last month	
☐	Contacts	last month	
☐	Desktop	17 hours ago	
☐	Documents	17 days ago	
☐	Downloads	16 minutes ago	
☐	Favorites	last month	
☐	Links	last month	
☐	Music	last month	
☐	OneDrive	last month	
☐	Pictures	last month	
☐	Roaming	last month	
☐	Saved Games	last month	
☐	Searches	last month	
☐	Videos	29 days ago	

Comparison: Anaconda Navigator vs. Google Colab

Feature	Anaconda Navigator	Google Colab
Execution	Local (runs on your hardware)	Cloud-based (runs on Google servers)
Resource Dependency	Depends on your CPU/GPU/RAM	Uses Google's cloud resources (free GPU/TPU)
Internet Requirement	No internet required for execution	Requires constant internet connection
Data Privacy	High (data stays on your machine)	Data is uploaded to Google Drive/Cloud
Setup	Requires manual installation/updates	Zero configuration; runs in a browser

5. Challenges Faced

- Ensuring that Anaconda Navigator was installed correctly without conflicting with existing Python installations.
- Verifying that the required environment variables and system paths were configured properly.
- Understanding the differences between package management in a local environment and cloud-based platforms.
- Learning the overall workflow and navigation of Anaconda Navigator for the first time.

6. Key Learnings

- Learned how to install and configure Anaconda Navigator as a complete Python development environment.
- Understood how to launch and use Jupyter Notebook and Spyder for Python programming.

- Learned the advantages of working in a local development environment, including offline access, better data privacy, and greater control over installed libraries.
 - Understood that Google Colab is suitable for quick experimentation and GPU-intensive tasks, while Anaconda Navigator is ideal for long-term local project development.
 - Gained practical knowledge of selecting the appropriate platform based on project requirements and available resources.
-

7. Conclusion

This task was successfully completed by installing and exploring Anaconda Navigator as a local Python development environment. Through this activity, I gained practical experience using Jupyter Notebook and Spyder while understanding the advantages of local development for offline work, data privacy, and package management.

Comparing Anaconda Navigator with Google Colab also helped me identify the strengths of both platforms and understand when each should be used. This task has provided a solid foundation for completing future AI/ML assignments and projects throughout the internship
